

COLORMAN

Integrated with
software from

Fotoware

The fastest way from camera to print!

ColorMan integrates Adobe InDesign and QuarkXPress with Color Factory in a professional way. Editors can use low-resolution images for layout placement.

Our advanced pre-press technology processes these images directly from the layout, using Color Factory from Fotoware, and produces high-quality output results.

QUICK

Workloads can be demanding at times. Therefore, ColorMan reduces this stress by simplifying the image-handling process. Layout artists can use low-resolution RGB.JPG's for all work within the layout.

When the layout is set, ColorMan automatically switches the low-resolution images to high-resolution versions using user-specific settings.

PLACING IMAGES

There are several ways of placing images in Adobe InDesign and QuarkXPress. You can use the command from within the application or you can drag and drop images from a web browser or your desktop. You can also retrieve images using FotoStation or FotoWeb.

Simply select the images you want to use, then drag and drop them into your layout. Scale, resize or rotate the images as you like, still using RGB.JPG's.

When satisfied with your work, allow ColorMan to send the images for pre-press handling in Color Factory. Color Factory returns high-resolution images and ColorMan automatically replaces your low-resolution images with the new ones, optimized and ready for printing.

CONTROL

ColorMan uses a sophisticated alert-system to avoid human errors such as printing pages with low-res images or saving EPS-files with low-res images.

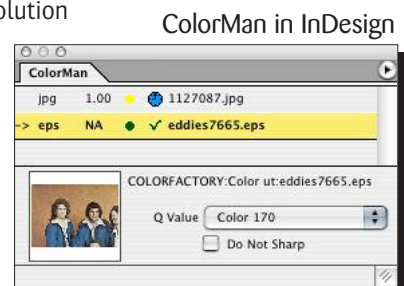

Margin values for the images can be set to avoid bleeding problems when printing.

SIMPLE

The ColorMan palette lets the user choose which images to work with. Just select the image(s) and the channel to use in Color Factory.

Color Factory returns the image produced and ColorMan replaces the low resolution image automatically with the same specifications and position.

The image is then ready for printing.

QUALITY

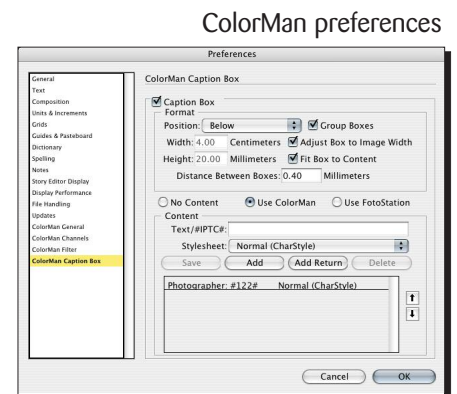

To avoid getting an image with too low resolution ColorMan gives the user a quality-control of the image. This is shown as Q-values which are calculated from the image size and resolution.

EXTRAS

A caption box may be mounted automatically when dropping an image to the layout.

The box can be placed in several different positions around the image and the text can be set using a style sheet from the preferences.

All information from the IPTC-fields may be placed instantly using this function.
